What is Learning?

Learning - improve automatically with experience

Using past experiences to improve future performance.

How we learn?

- **Rote Learning (memorization)**
 - Memorizing things without knowing the concept/ logic behind them
- **Passive Learning (instructions)**
 - Learning from a teacher/expert.
- **Analogy (experience)**
 - Learning new things from our past experience.
- **Inductive Learning (experience)**
 - On the basis of past experience formulating a generalized concept.
- **Deductive Learning**
 - Deriving new facts from past facts.

Why Machine Learning?

Traditional Programming

Machine Learning

What is Machine Learning?

- General definition:
 - Machine Learning is the field of study that gives computers the ability to learn without being explicitly programmed.
Arthur Samuel, 1959
- And a more engineering-oriented one:
 - A computer program is said to learn from **experience E** with respect to **some task T** and some **performance measure P**, if its performance on T, as measured by P, **improves with experience E**.
 - Tom Mitchell, 1997

What is Machine Learning

- Machine learning provides systems, the ability to **automatically learn** and improve **from experience** **without** being **explicitly programmed**.
- Machine learning **focuses** on the development of computer **programs** that can **access data** and use it **learn for themselves**.

What is Machine Learning

- The process of learning begins with
 - observations or **data**, such as examples,
 - direct experience, or instruction, in order to look for **patterns** in data
 - and make **better decisions** in the future based on the examples that we provide.

- The primary aim is to allow the computers learn automatically without human intervention or assistance and adjust actions accordingly.

7

Ex1: Spam Filtering

Decide which emails are spam and which are important.

Goal: use emails seen so far to produce good prediction rule for future data.

15CS73 - Machine Learning

Harivinod N

8

Ex1: Spam Filtering

Represent each message by features. (e.g., keywords, spelling, etc.)

	"money"	"pills"	"Mr."	bad spelling	known-sender	spam?
	Y	N	Y	Y	N	Y
	N	N	N	Y	Y	N
	N	Y	N	N	N	Y
example	Y	N	N	N	Y	N
	N	N	Y	N	Y	N
	Y	N	N	Y	N	Y
	N	N	Y	N	N	N

Reasonable RULES:

Predict SPAM if unknown AND (money OR pills)

Predict SPAM if $2\text{money} + 3\text{pills} - 5\text{known} > 0$

Linearly separable

Ex1: Spam Filtering

- Spam filter can learn to **flag spam** given examples of spam emails (e.g., flagged by users) and examples of regular (nospam, also called "ham") emails.
- The examples that the system uses to learn are called the *training set*. Each training example is called a *training instance* (or *sample*).
- In this case,
 - the **task T** is to flag spam for new emails,
 - the **experience E** is the training data, and
 - the **performance measure P** needs to be defined; Ex: ratio of correctly classified emails.

Ex2: A checkers learning problem

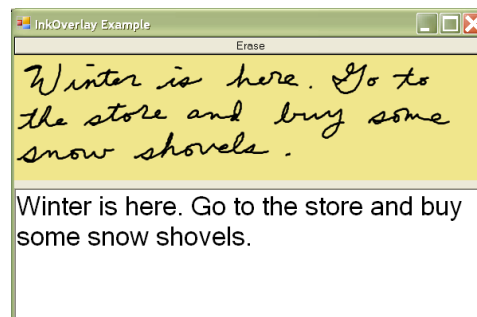

- **Task T** - Playing checkers
- **Performance Measure P** - Percentage of games won against opponent
- **Training Experience E** - Playing practice games against itself

Ex3: A handwriting recognition learning problem

- **Task T**: recognizing and classifying handwritten words within images
- **Performance measure P**: percent of words correctly classified
- **Training experience E**: a database of handwritten words with given classifications

Ex4: A robot driving learning problem

- T: driving on public 4-lane highways using vision sensors
- P: average distance traveled before an error (as judged by human overseer)
- E: a sequence of images and steering commands recorded by observing a human driver

Visual Object Categorization

We are given categories for these images: What are these?

- A classification problem: predict category y based on image x .
- Little chance to “hand-craft” a solution, without learning.
- Applications: robotics, HCI, web search (a real image Google...)

15CS73 - Machine Learning

Harivinod N

Applications

■ Image Classification

- Handwritten digit recognition (convert hand-written digits to characters 0..9)

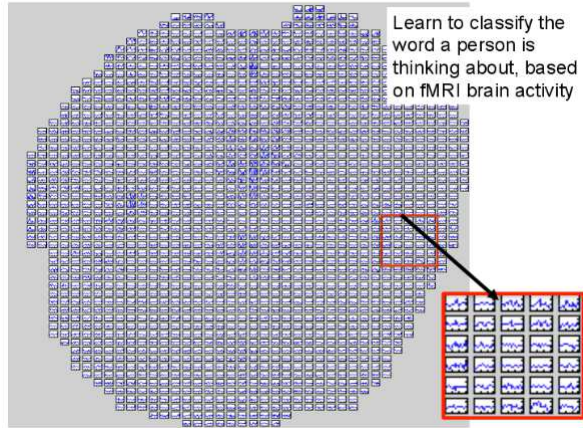

Applications

- Face Detection and Recognition

Applications

Applications

Text analysis

Peter H. van Oppen, **Executive Vice President & Chief Financial Officer** of **ACI**, **ACI** has served as **Director of ACI** since its acquisition by Interpoint in 1994 and a **Director of ACI** since 1986. Until its acquisition by Crane Co. in October 1996, **Mr. van Oppen** served as **Executive Vice President**. Prior to 1995, **Mr. van Oppen** worked as a **Senior Consultant** at **Ernst & Young LLP** and at **Bain & Company** in Boston and London. He has additional experience in medical electronics and venture capital. **Mr. van Oppen** also serves as a **Director** of **Spacelabs Medical, Inc.** He holds a B.A. from Whitman College and an M.B.A. from Harvard Business School, where he was a **Baker Scholar**.

Applications

Photo tagging

15CS73 - Machine Learning

Harivinod N

27

Applications

- Weather prediction

- Medicine:
 - diagnose a disease
 - input: from symptoms, lab measurements, test results, DNA tests, ...
 - output: one of set of possible diseases, or “none of the above”
 - examples: audiology, thyroid cancer, diabetes, ...
 - or: response to chemo drug X
 - or: will patient be re-admitted soon?
- Computational Economics:
 - predict if a stock will rise or fall
 - predict if a user will click on an ad or not
 - in order to decide which ad to show

15CS73 - Machine Learning

Harivinod N

28

Applications

- Segment customers and **find the best marketing strategy** for each group
- **Recommend products** for each client based on what similar clients bought
- Detect which **transactions** are likely **to be fraudulent**
- **Predict** next year's revenue
- Learning from medical records which **treatments** are most **effective**

Applications

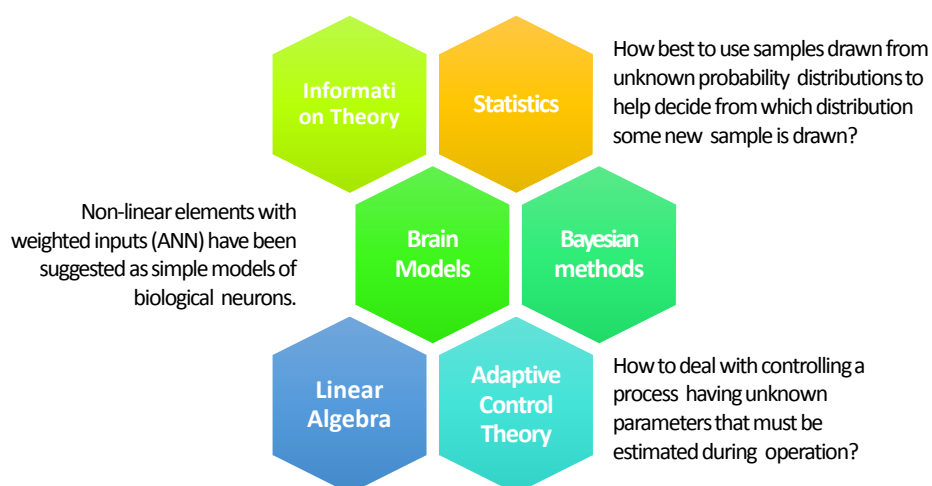

- Self Customizing programs - houses learning to **optimize energy** costs based on particular usage patterns of their occupants
- Personal software assistants learning the evolving interests of their users in order to highlight **relevant stories from online newspapers**
- **Autonomous** driving
- **Speech** Recognition

Some successful ML applications

- Learning to recognize spoken words (Lee, 1989; Waibel, 1989).
- Learning to drive an autonomous vehicle (Pomerleau, 1989).
- Learning to classify new astronomical structures (Fayyad et al., 1995).
- Learning to play world-class backgammon (Tesauro 1992, 1995).

Areas/Disciplines influence ML

Areas/Disciplines influence ML

Philosophy

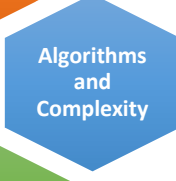

Psychology

How to model human performance on various learning tasks?

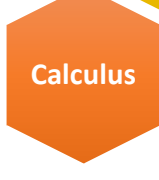

Artificial Intelligence

Algorithms and Complexity

How to write algorithms to acquire the knowledge humans are able to acquire, at least, as well as humans?

Calculus

Evolutionary Models

How to model certain aspects of biological evolution to improve the performance of computer programs?

15CS73 - Machine Learning
Harivinod N
33

Stages in ML process

1. Classify the Problem
2. Acquire Data
3. Process Data
4. Model the Problem
5. Validate and Execute
6. Deploy

Types of Machine Learning

1. **Shallow Learning**
 - Algorithms with Few Layers
 - Better for Less Complex and Smaller Data sets
 - Ex: Logistic Regression and Support vector Machines

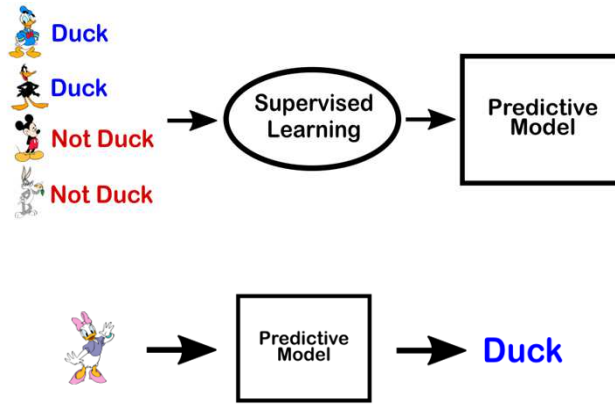

2. **Deep Learning**
 - New technique that uses many layers of neural network (a model based on the structure of human brain)
 - Useful when the target function is very complex and data sets are very large.

Classification of ML algorithms

1. **Supervised Learning (inductive) learning**
 - Training data includes desired outputs
 - X and Y; Given an observation X what is the best label for Y
 - Example: Classification, Regression problems
2. **Unsupervised Learning**
 - Training data does not include desired outputs
 - X; Given a set of X cluster or summarize them
 - Example: Clustering
3. **Semi Supervised Learning**
 - Training data includes a few desired outputs
4. **Reinforcement Learning**
 - Determine what to do based on Rewards and punishments
 - Example: Robot movement, Game AI

Why is ML is Important?

- Some tasks **cannot be defined well**, except by examples (e.g., recognizing people).
- Relationships and correlations** can be hidden within large amounts of data. Machine Learning/Data Mining may be able to find these relationships.
- Human designers often produce machines that do not work as well as desired in the environments in which they are used.
- The amount of knowledge available about certain tasks might be **too large** for explicit encoding by humans (e.g., medical diagnostic).

Why is ML is Important?

- Environments **change** over time.
- New knowledge about tasks is constantly being discovered by humans. It may be difficult to continuously re-design systems “by hand”.

Skills required for ML Engineer

1. Mathematical Skills
 - Probability, Statistics, Linear Algebra, Calculus
2. Programming Skills
 - Coding, Algorithms, DS, OOPs
 - Python, R, Matlab, Java
3. Data Engineering Skills
 - Data Preprocessing, Analysis, Visualization
4. Knowledge of ML algorithms
 - Shallow and Deep learning
 - Supervised, Semi-Supervised, Unsupervised, Reinforcement
5. Knowledge of ML Frameworks
 - SciKit Learn, Tensorflow, Caffe, Theano, Spark, many more

In summary, ML is great for:

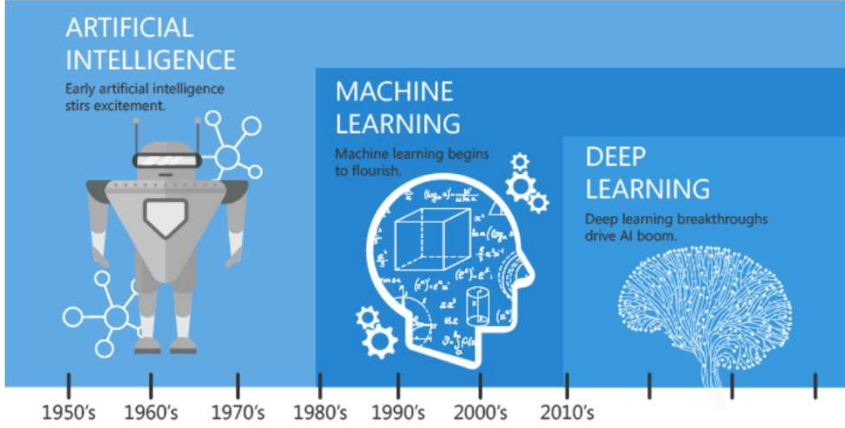

- Problems for which existing solutions **require a lot of hand-tuning** or long lists of rules: one Machine Learning algorithm can often simplify code and perform better.
- **Complex problems** for which there is no good solution at all using a traditional approach: the best Machine Learning techniques can find a solution.
- **Fluctuating environments**: a Machine Learning system can adapt to new data.
- Getting insights about **complex problems** and large amounts of data.

Some issues...

- What algorithms can approximate functions well and when?
- How does number of **training examples** influence accuracy?
- How does **complexity of hypothesis representation** impact it?
- How does **noisy data** influence accuracy?
- What are the theoretical **limits** of learnability?
- How can **prior knowledge** of learner help?
- What **clues** can we get from **biological learning** systems?
- How can systems **alter** their own representations?

Where we are?

ARTIFICIAL INTELLIGENCE
Early artificial intelligence stirs excitement.

MACHINE LEARNING
Machine learning begins to flourish.

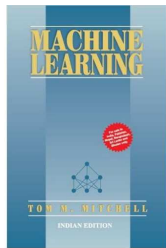

DEEP LEARNING
Deep learning breakthroughs drive AI boom.

1950's 1960's 1970's 1980's 1990's 2000's 2010's

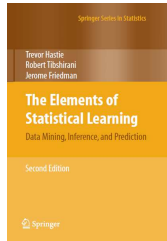

Since an early flush of optimism in the 1950's, smaller subsets of artificial intelligence - first machine learning, then deep learning, a subset of machine learning - have created ever larger disruptions.
